STORE OPERATIONS · OAKRIDGE PARK

Oakridge Product Suite

by Li Snyder

A store operations app I designed and built for the Oakridge Park team, plus a daily deployment for managers that builds itself.

It replaced printouts, whiteboards and paper copies that didn't update each other with one shared system. Associates use it on the store iPhones for product lookup, counts, consolidations, receiving and floor stock. Everything lands in one shared Google Sheet.

5 + Home
focused modules in place of 7 tabs and paper systems

1:06 vs 3:25
receiving 5 boxes, app vs by hand, in testing

Offline
installs from the web on store iPhones, no app store

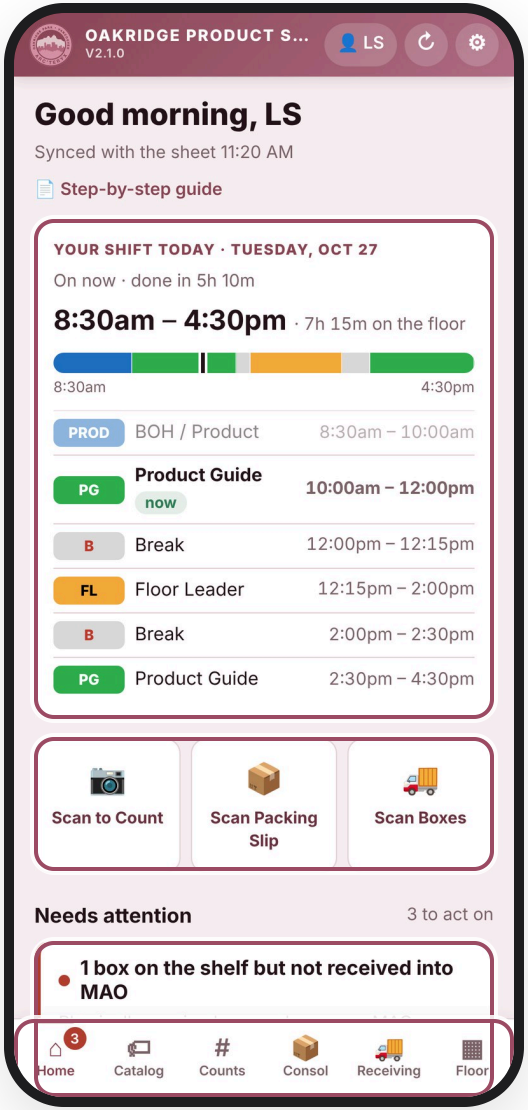

$0
to run, on GitHub Pages and Google Sheets

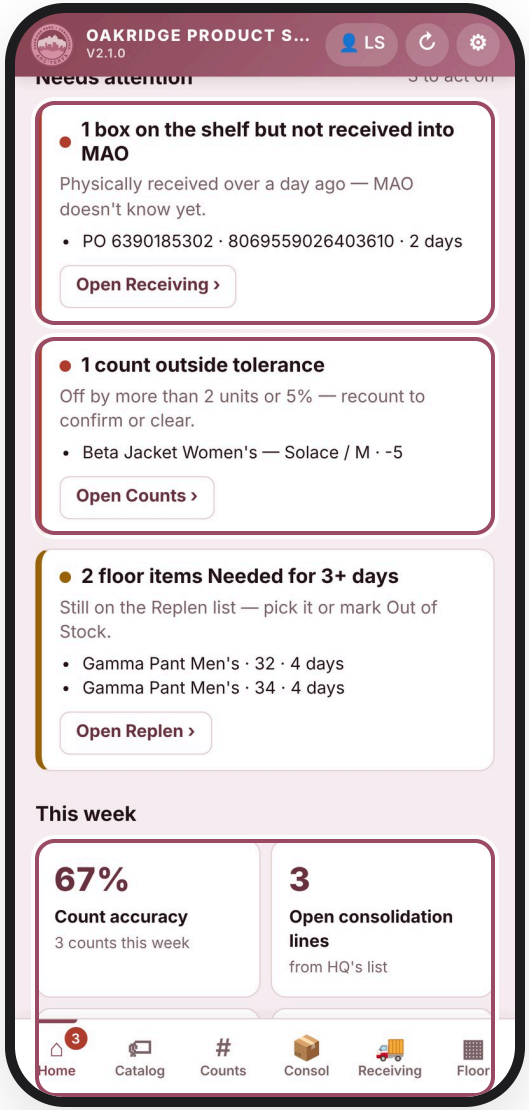

App screens show sample data. Staff names and sales figures in the Google Sheets screenshots are blurred.

One screen to start the shift

What's yours today and what needs doing, without opening every tab.

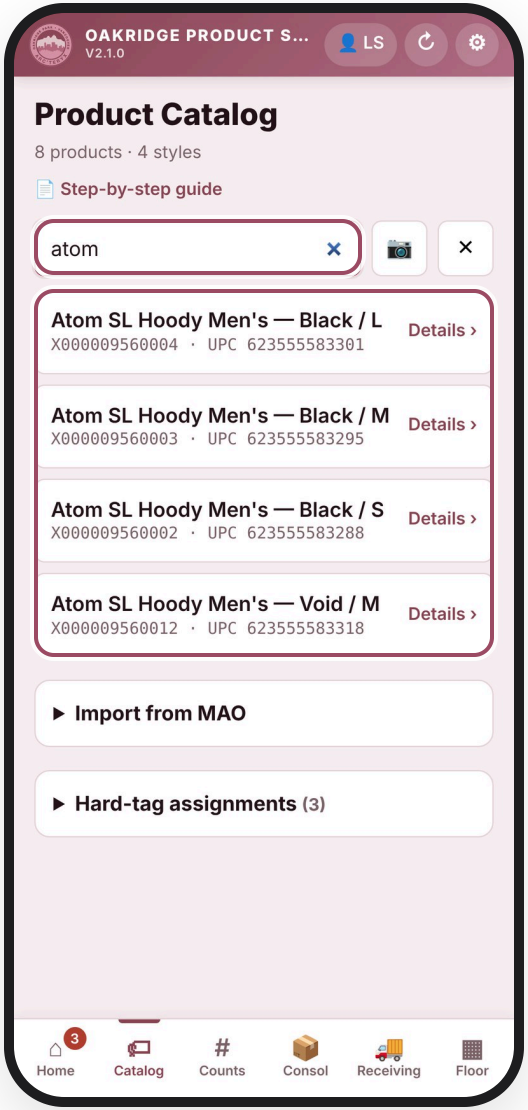

1. **Your shift today:** roles, breaks and a live "now" marker, read from the auto-built deployment
2. **One-tap scanning** for the three most common jobs
3. **Needs attention:** the app finds slipped work on its own
4. **Five focused modules** replace seven tabs

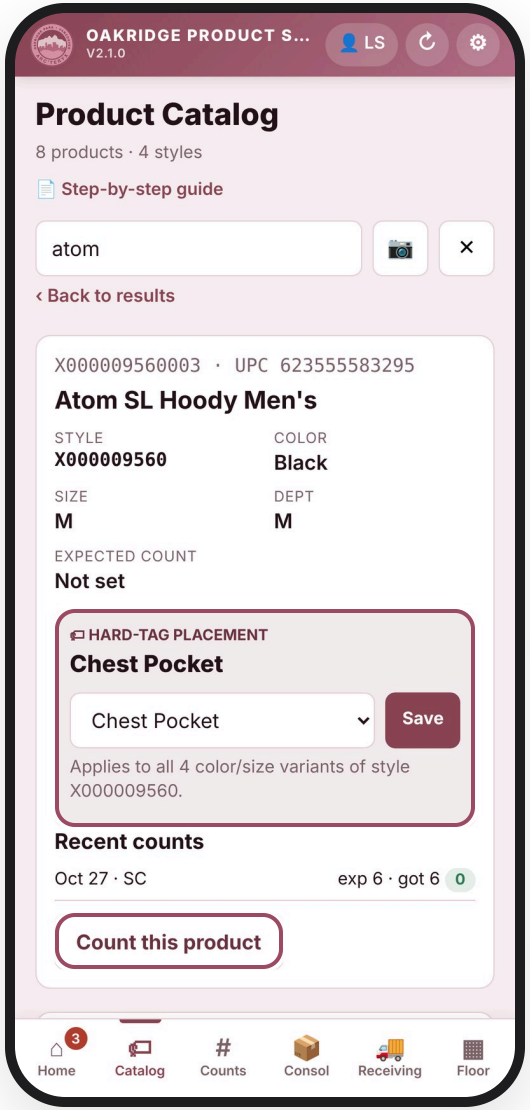

5. Boxes on the shelf but **not yet received in MAO**, with how long they've waited
6. Counts off by more than 2 units or 5%, **flagged for a recount**
7. **Weekly KPIs:** count accuracy and open consolidation lines

Hard-tag placement everyone can find

Before: hard-tag printouts on a wall, with exceptions passed on by word of mouth. **Now:** one searchable source of truth.

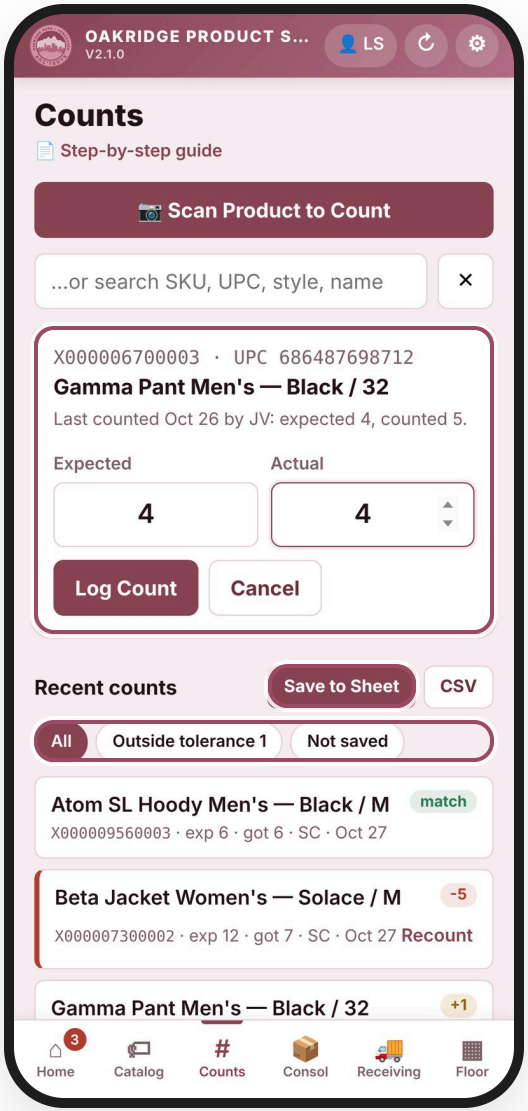

1. **One search** for SKU, UPC, style or name, or scan the barcode
2. Every colour and size, with its UPC, in one list

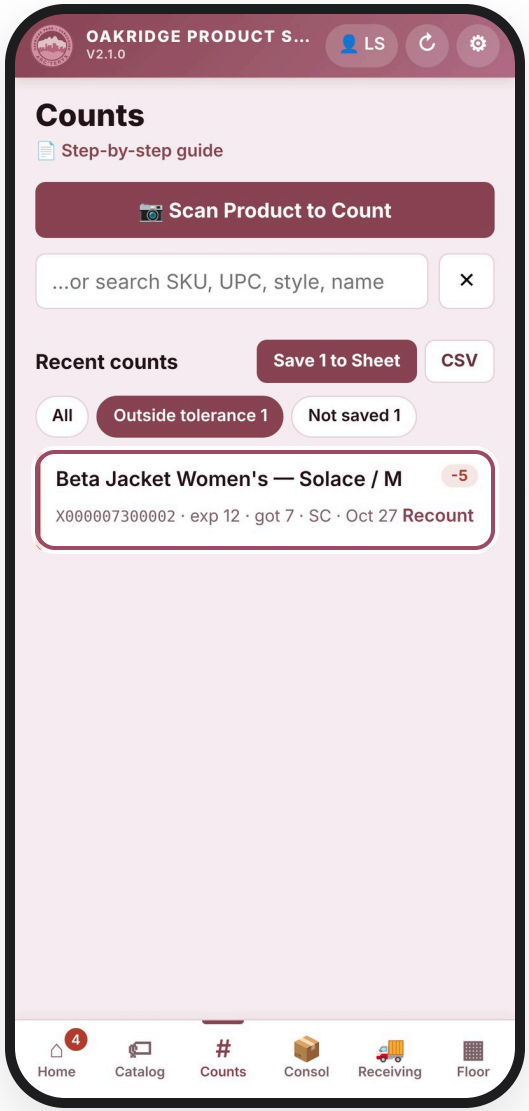

3. **Hard-tag placement:** where the security tag goes, set once for the whole team
4. Start a count straight from the product page

Every count logged and checked

Before: counts from memory or loose printouts, with no record of when an item was last checked. **Now:** every count timestamped, initialled and compared.

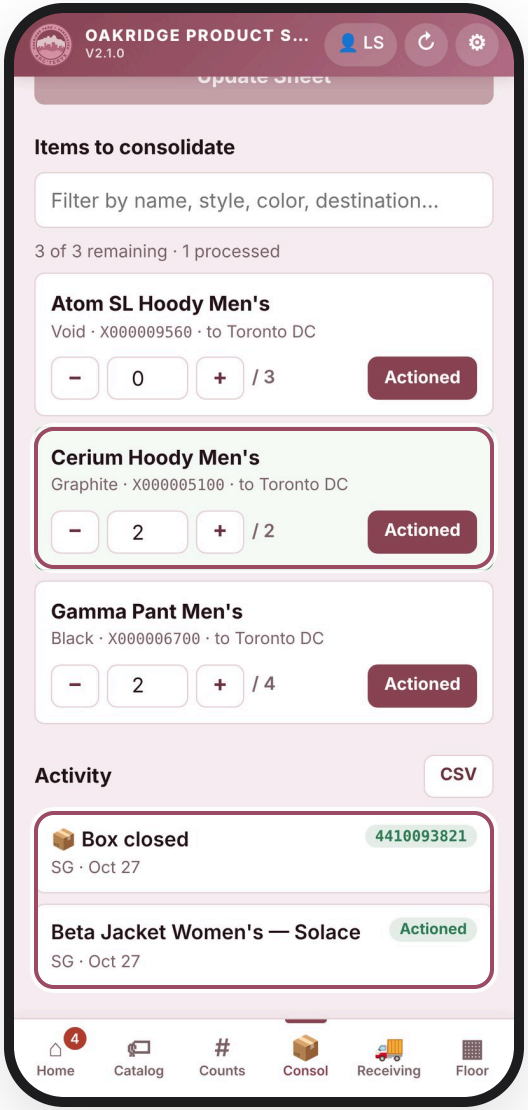

1. **Scan, then enter expected and actual.** The last count is shown for context
2. Counts save to the shared sheet in **one batch**
3. Filter to counts **outside tolerance** or not yet saved

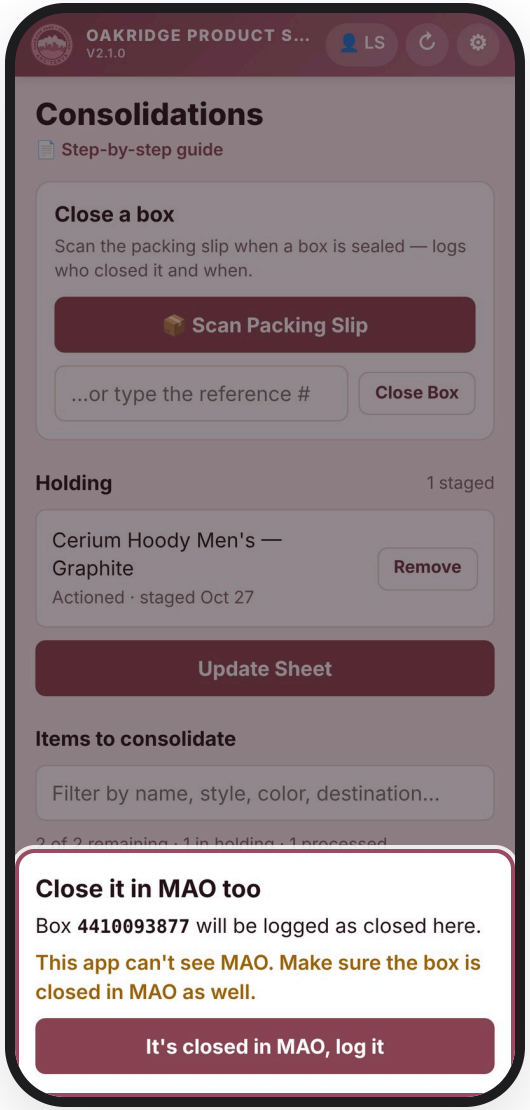

4. **Out-of-tolerance counts** stand out and prompt a recount

One live list instead of three paper copies

Before: up to three paper copies that didn't update each other, then re-checking. **Now:** one list everyone works from.

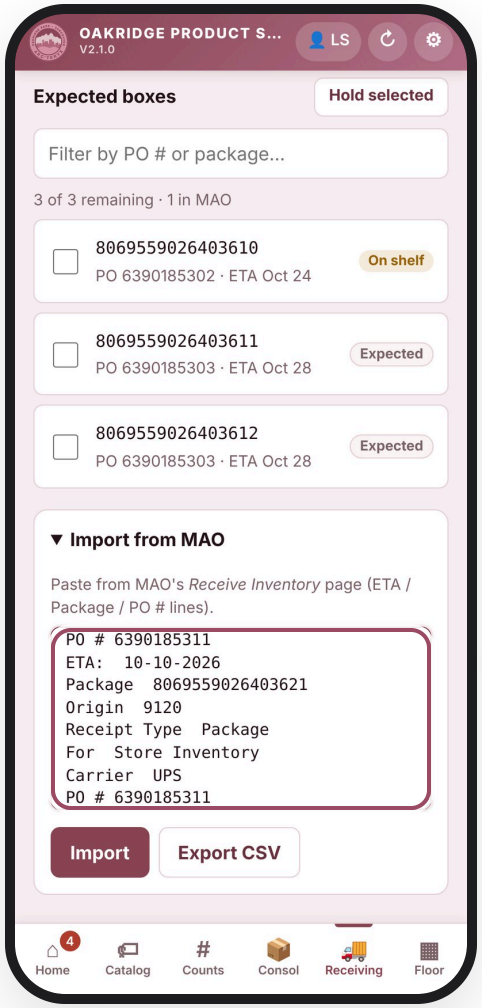

1. **Actual Count stepper** for each item on HQ's consolidation list
2. **Activity log:** who closed which box, and when

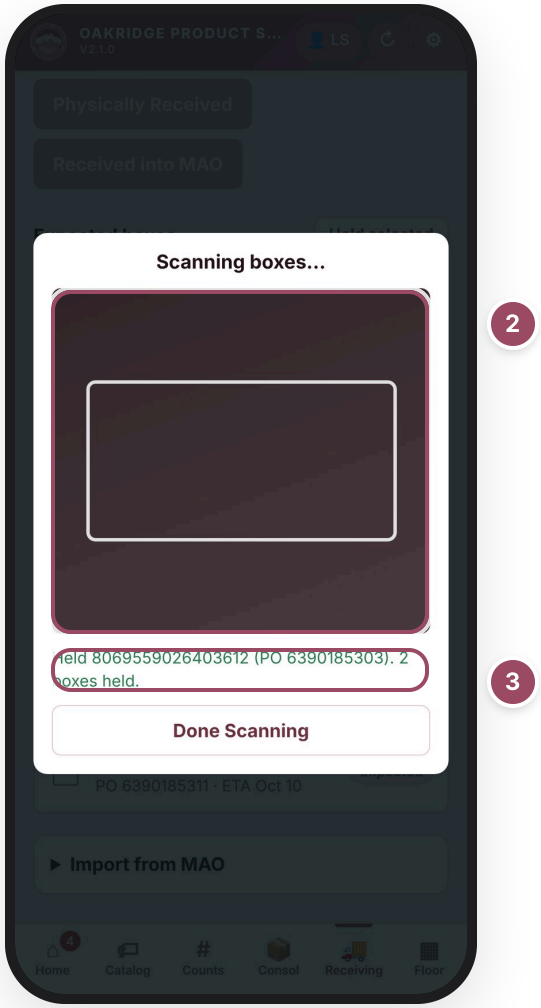

3. Closing a box needs a **confirm that it's closed in MAO too**, so the two systems never drift apart

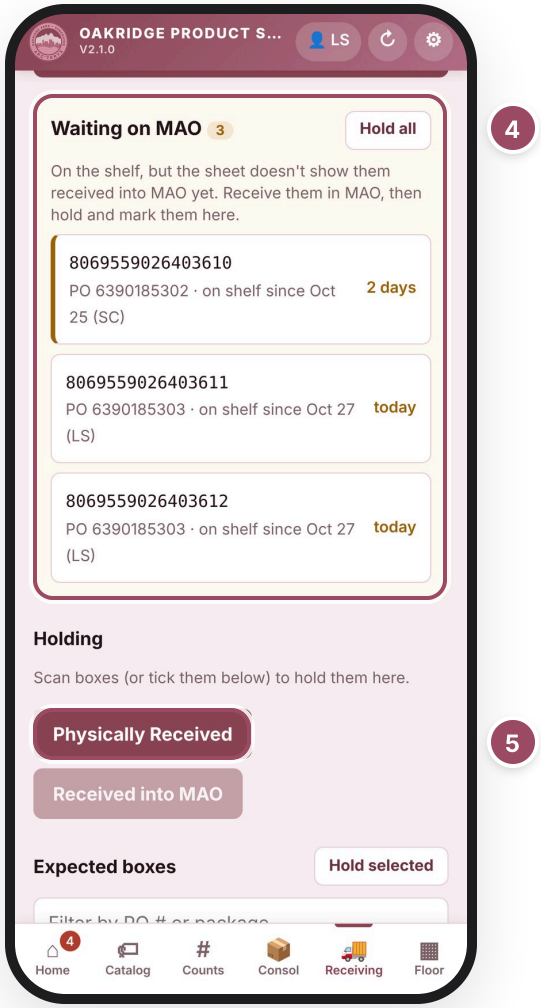

Paste, scan, done IN TESTING

Before: copy barcodes under PO numbers, photograph, scan, search, tick and initial, twice. **Now:** in a 5-box test, 1:06 with the app vs 3:25 by hand (not counting the MAO receive step).

1

1 **Paste the shipment from MAO.** Boxes and POs are read automatically

2 **Continuous camera scanning:** each box label is matched to its PO

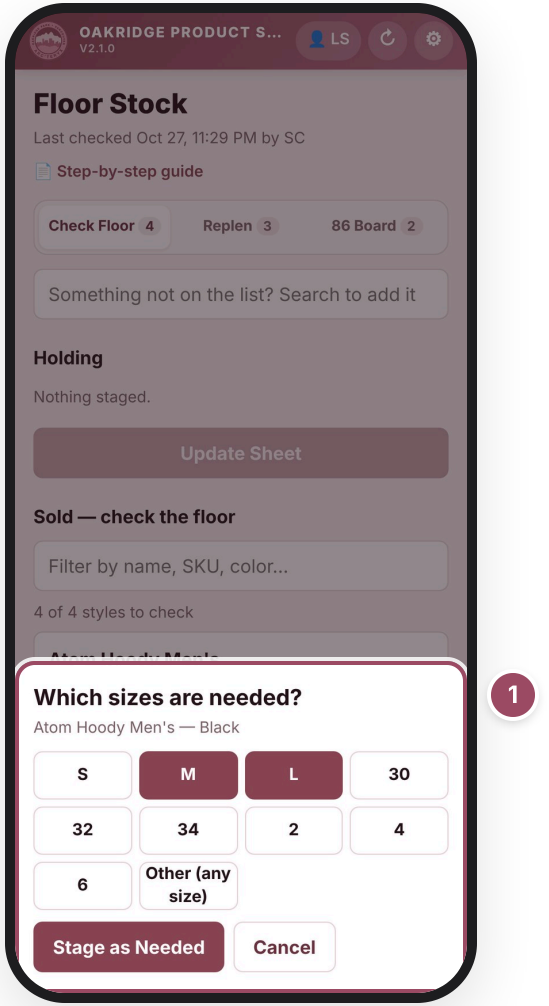

3 Instant feedback on every scan

4 **Waiting on MAO:** boxes on the shelf but not yet received in MAO

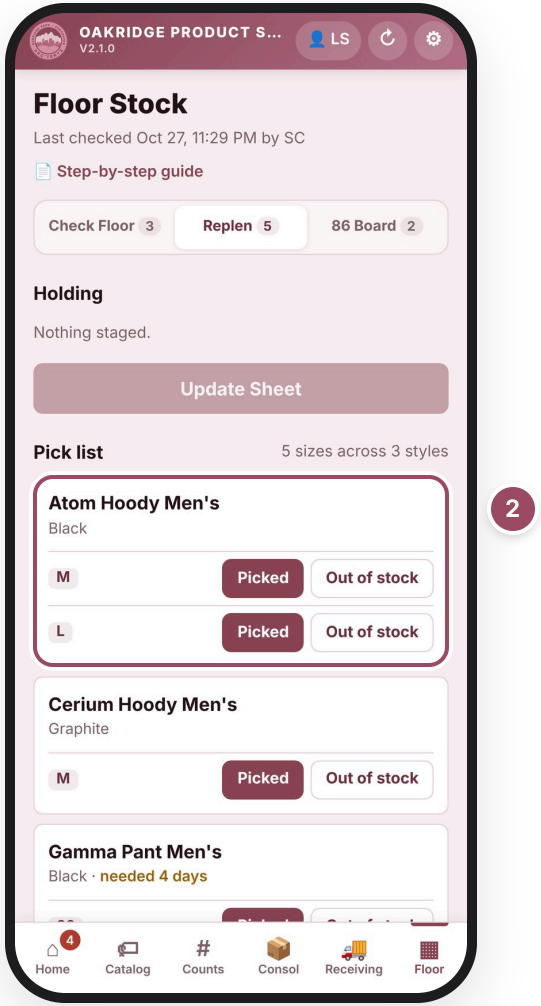

5 **Two-step handoff:** Physically Received, then Received into MAO

From sold to restocked, tracked

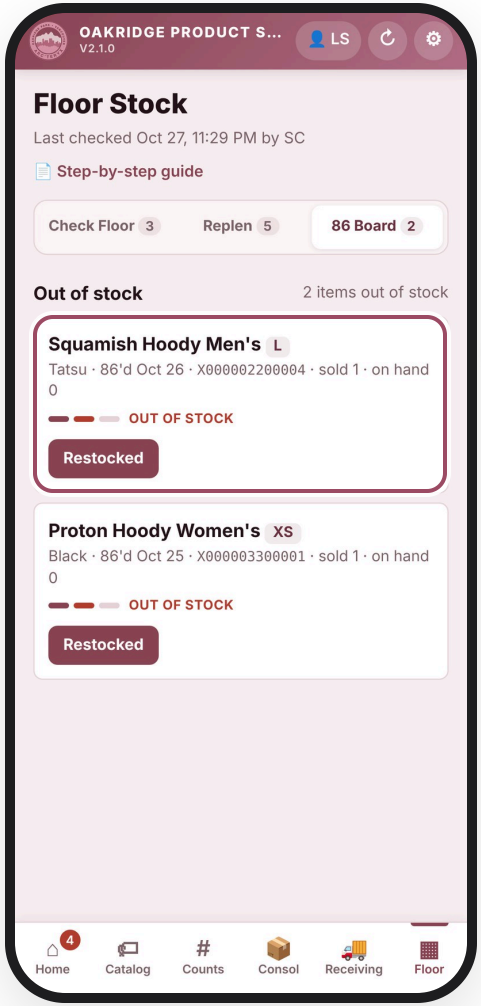

Before: printouts and an 86 whiteboard that got wiped. **Now:** Check Floor, Replen and the 86 Board as one lifecycle.

1

2

3

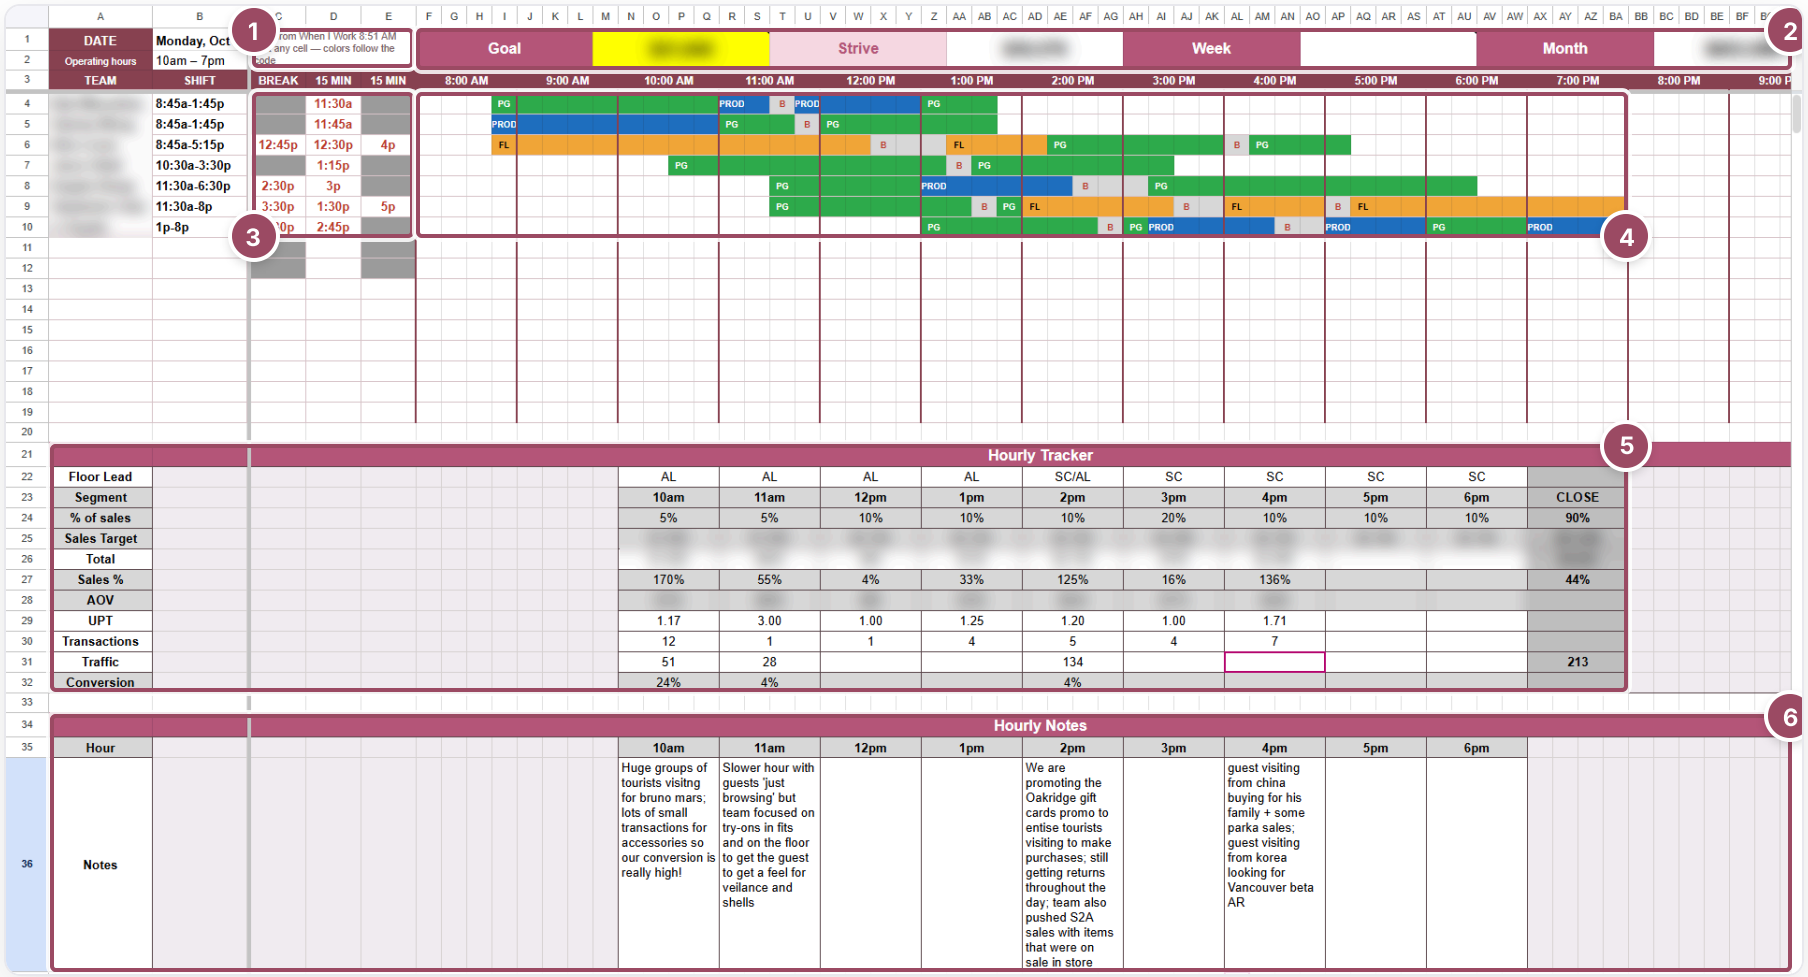

1 Mark **which sizes the floor needs** for each sold style

2 **Pick list grouped by style:** Picked or Out of stock per size

3 Out of stock goes to the **86 Board** until it's restocked

A deployment that builds itself

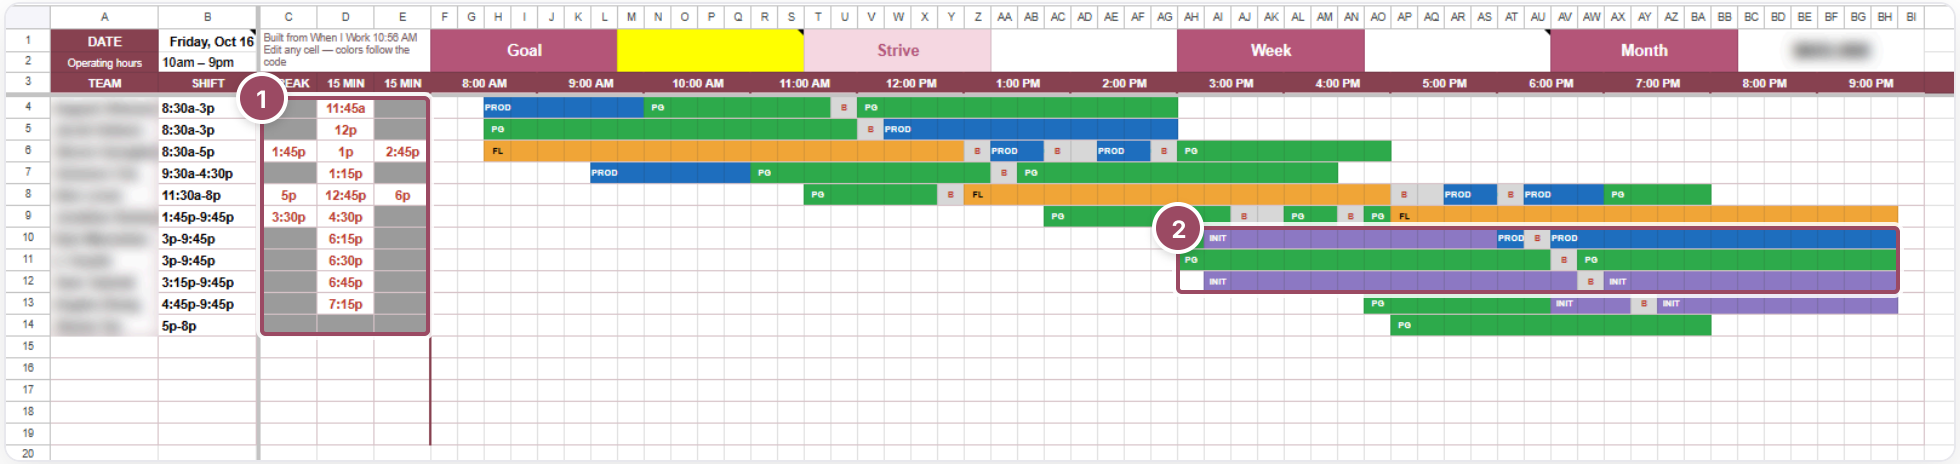

For managers: the schedule, roles, breaks and an hourly sales tracker are built at 5am from When I Work. Leads can still edit anything by hand.

1. **Built automatically** each morning from the When I Work schedule
2. **Goals:** daily goal, Strive (1.4× goal), week and month
3. **Breaks placed by shift length,** staggered so the floor stays covered. Grey means no break due
4. **Colour-coded roles** in 15-minute blocks: Product Guide, BOH / Product, Floor Leader
5. **Hourly Tracker:** targets split from the goal, sales filled in by pasting the MAO export. Sales %, AOV, UPT and conversion are calculated
6. **Hourly Notes** in large boxes, one per hour

Edit the sheet, see it on the phone

Changes made on the sheet reach each associate's "Your shift today" card within minutes.

1. **Move a break** by typing a new time or repainting the B cells. The other side updates to match
2. **Type a code** and the block recolours. Touching blocks of the same role merge into one

How it's built

- **App:** a plain-JavaScript progressive web app. Works offline, scans barcodes with the camera, installs to the home screen
- **Backend:** Google Apps Script on the store's shared Google Sheet, protected by an access key
- **Deployment:** reads the When I Work schedule, places breaks under coverage rules and keeps hand edits in sync
- **Rollout:** ran side by side with the original app, then replaced it in place with no lost work
